

ECOSYS AI

Smart Waste Segregation App

"Scan. Sort. Sustain."

DOMAIN: Environment domain

PROBLEM STATEMENT:

Recycling systems fail due to poor segregation practices

TEAM MEMBERS:

Mayana Mohammad Farhan Akthar Khan (1HK24CS132)

Mohammed Asim (1HK24CS148)

Moin Ahmed(1HK24CS166)

Mohammed Rumaan(1HK24CS160)

REPORT ATTRIBUTES:

- 1.Global waste crisis explanation
- 2.Our solution for waste segregation
- 3.Operational workflow
- 4.Technical features
- 5.Psycological drivers
- 6.Impact Assesment
- 7.Future roadmap
- 8.Scaling the mission
9. Conclusion

1. The Global Waste Crisis

1.1 The Recycling Paradox

The world is drowning in waste not because we don't recycle, but because we don't recycle correctly. While recycling infrastructure exists globally, the quality of the material collected at the source is often too degraded to be commercially viable for processing.

1.2 Contamination: The Silent Killer

Contamination is the primary destroyer of the circular economy. When non-recyclable materials enter the recycling stream, they don't just remain as trash—they ruin the entire batch of clean materials. A single greasy pizza box or a half-full plastic bottle can contaminate hundreds of pounds of high-quality paper or plastic.

91% Plastic never recycled	50% Contamination rate	1/3 People are confused
--------------------------------------	----------------------------------	-----------------------------------

The "Aspiration" problem, or 'wish-cycling', occurs when well-intentioned citizens throw items into recycling bins hoping they are recyclable, leading to catastrophic contamination levels.

2. Our Solution: Ecosys AI

2.1 A Behavioral Intervention

Ecosys AI is not just an application; it is a digital intervention designed to fix human behavior at the point of disposal. We bridge the gap between the user and the bin using advanced Computer Vision and integrated Gamification modules.

Core Pillars of the Solution:

- **Instant Clarity:** Our AI eliminates the mental load of waste sorting by providing immediate visual feedback.
- **Gamified Motivation:** We turn a mundane chore into an engaging game through virtual environmental growth.
- **Verified Honesty:** A community-led verification system ensures that users are performing the actions they claim.
- **Tangible Rewards:** Points collected in the app represent real economic value through strategic brand partnerships.

By providing a "Digital Guide" in the pocket of every citizen, we aim to eliminate the 60 seconds of doubt that typically leads to landfill waste. Ecosys AI replaces "guessing" with "verification."

3. Operational Workflow

The entire Ecosys Al cycle is optimized for the fast-paced modern lifestyle, taking less than one minute from pocket to bin.

Step 1: The Scan

The user opens the app and captures a photo of the waste item. Our interface is designed for one-handed operation to maximize convenience.

Step 2: AI Classification

The integrated AI model identifies the material type (PET, HDPE, Paper, Glass, etc.) in milliseconds using local processing for speed.

Step 3: Guidance

The app displays a prominent, color-coded bin instruction that matches standard municipal sorting systems.

Step 4: Verification & Reward

User takes a 'proof-of-sort' photo. Upon verification, rewards are credited to the user's wallet immediately, reinforcing the positive habit.

4. Technical Features

EcosysAlleverages cutting-edge technologyto provide a high-performance experience across all smartphone tiers, ensuring inclusivity in environmental action.

Key Module	Technical Detail
AI Waste Recognition	Optimized Convolutional Neural Networks (CNN) for Plastic, Metal, Paper, and Glass detection.
Virtual Growth Engine	A 5-stage virtual tree that visualizes environmental impact through a growing avatar.
Verification System	Proof-of-action system with bonus point incentives to ensure system integrity.
Multilingual Core	Hindi/English toggle for mass-market adoption and regional accessibility.
Edge Computing	Lightweight models that run locally to ensure functionality even in low-connectivity areas.

5. Psychological Drivers

OursolutionisbuiltonthefoundationoftheFoggBehavior Model: **Motivation + Ability + Prompt.**

5.1 Social Proof & Competition

The integrated leaderboard triggers the natural competitive nature of humans. By showing who is the "greenest" in a circle of friends or a residential complex, we drive engagement through social status.

5.2 Instant Gratification

Traditional recycling shows impact over years, which is too slow for the human brain to register as a reward. Ecosys AI shows impact in seconds through points and visual growth.

5.3 Accountability

Knowing that an AI or a community member is verifying the sorting photo prevents 'lazy' sorting and ensures that high-quality recyclables reach the processing plants.

"We are not just asking people to recycle; we are making it nearly impossible for them to fail."

6. Impact Assessment

6.1 EfficiencyGains

The potential for change is astronomical when applied to urban waste management systems. A 60-80% efficiency gain is projected in recycling plant throughput due to the reduction in initial contamination.

6.2 Daily Habit Formation

By gamifying the process, we turn a tedious task into a daily habit loop. This behavioral shift is the only way to achieve long-term sustainability in urban environments.

Key Targets:

- Reduce landfill dependency by 40% in high-adoption areas.
- Reach 10,000 active users within the first 6 months.
- Achieve a 95% accuracy rate in user-sorted waste.

7. Future Roadmap

Ecosys AI is designed for modular growth and seamless integration with existing smart city infrastructures.

Phase 1: Pilot Launch

Deployment in 5 major residential complexes and 3 university campuses. The goal is to gather baseline behavioral data and refine the AI model.

Phase 2: Corporate Integration

Partnering with FMCG (Fast-Moving Consumer Goods) brands. Users who recycle specific brand packaging will receive exclusive discounts and loyalty points from those brands.

Phase 3: Smart Bin IoT

Integration with Bluetooth-enabled smart bins. These bins will open automatically only when the app verifies a successful scan, creating a physical barrier to contamination.

8. Scaling the Mission

8.1 Urban Expansion

Our strategy involves moving from controlled environments (universities/complexes) to open municipal systems. By partnering with local governments, Ecosys AI can become the official interface for city-wide waste management.

8.2 Data for Policy

The anonymized data generated by user scans provides a heatmap of waste generation. Municipalities can use this data to optimize collection routes and identify areas that need more recycling infrastructure.

8.3 Educational Outreach

The app will serve as an educational platform for schools, using its gamified interface to teach the next generation about the circular economy and material science.

9. Conclusion

"Let's make recycling the easiest choice, not the hardest."

Ecosys AI provides the missing link in the global waste management chain. By empowering the individual with AI and motivating them with tangible rewards, we transform waste from a liability into a resource.

Why?

The image shows a black plastic bag, which is made of plastic material.

Quick Tips

- Check with local authorities for specific guidelines on disposing of plastic bags, as some may have special collection programs.
- Consider reusing the bag if it's still in good condition.
- Avoid littering or throwing plastic bags in recycling bins, as they can cause problems during the recycling process.
- If the bag contains waste, make sure to tie it properly before disposing of it in the black bin.

Black Bin

Recycling Instructions

1

Empty any remaining liquid from the container

2

Remove caps, pumps, and labels (recycle separately if possible)

3

Rinse briefly to remove food residue

4

Crush to save space in the recycling bin

5

Place in the Blue Recycling Bin

Environmental Impact

Recycling one plastic bottle saves enough energy to power a 60W light bulb for 6 hours and reduces CO₂ emissions by approximately 0.4kg.
